DAPPER DETAILING PROS

SCOPE OF WORK

Website, Booking System, Franchise Management and Employee Portal Revamp

Document Information	Details
Project Type	Custom Web Platform Development and Existing System Revamp
Client	Dapper Detailing Pros
Target Market	Canada
Version	1.0 — Initial Project Scope

Prepared as a developer-facing scope document for discovery, estimation, design, implementation, testing, and launch planning.

CONFIDENTIAL — PROJECT PLANNING DOCUMENT

1. Project Overview

Dapper Detailing Pros intends to undertake a complete redevelopment of its existing website and internal employee management portal to establish a unified, scalable, and franchise-oriented digital platform.

The project will replace the existing WordPress website and BookingPress Pro implementation with a custom-built website and booking management system. Existing booking data will be retained and migrated to the new platform.

The project will also include a comprehensive revamp of the existing employee portal, incorporating its current functionality, including employee onboarding, testing, GPS/location tracking, time tracking, dealership tagging, and B2B job management.

The website, booking system, employee portal, and administrative dashboards will operate as interconnected components of a centralized platform. The architecture must support multiple franchises and locations under the Dapper Detailing Pros brand, with controlled access to bookings, employees, customers, financial information, and operational records.

The platform will integrate Square for payment processing and POS workflows, Apple Calendar synchronization, customized invoicing, automated email notifications, and Mailchimp for marketing subscription forms and popup campaigns. The solution must be designed for future expansion as Dapper Detailing Pros grows its franchise network.

2. Project Objectives

1. Completely redesign and rebuild the existing website using a custom user interface and modern web technologies.
2. Replace BookingPress Pro with a flexible, custom booking engine.
3. Retain and migrate existing booking data from the current system.
4. Develop a centralized administrative dashboard for managing the website, bookings, franchises, locations, employees, and business operations.
5. Revamp the existing employee portal while preserving its established functionality.
6. Introduce role-based and location-based access controls for franchise operations.
7. Integrate Square for online payments and supported in-person POS workflows.
8. Implement a centralized, customizable invoice generation and management system.
9. Synchronize bookings with Apple Calendar across the company, franchise locations, and individual employees.
10. Automate customer, employee, and administrator email notifications.
11. Integrate Mailchimp with configurable popup forms and newsletter subscription functionality.
12. Establish a secure and scalable foundation for franchise expansion and centralized business management.

3. Project Scope

3.1. Custom Website Development

The existing website will undergo a complete UI/UX redesign and redevelopment. The new website must be responsive, accessible, optimized for search engines, and suitable for desktop, tablet, and mobile devices.

3.1.1. Website Structure

- Homepage; About Us; Services overview; individual service pages; vehicle-specific service pages.
- Fleet and commercial detailing; dealership and B2B services.
- Franchise and location pages; online booking interface; request-a-quote forms; contact page.
- Customer account and booking history; Frequently Asked Questions.
- Privacy Policy; Terms and Conditions; Cancellation and Refund Policy; other required legal and informational pages.

3.1.2. Supported Vehicle and Equipment Categories

- Motorcycles; hatchbacks; sedans; SUVs; pickup trucks; vans; other passenger vehicles.
- Commercial trucks and heavy-duty vehicles.
- Heavy machinery and equipment.
- Aircraft.
- Boats and other applicable marine vehicles.

The service catalogue must be configurable so additional vehicle categories can be introduced without major redevelopment.

3.1.3. Supported Services

- **Automotive detailing:** interior detailing, exterior detailing, full vehicle detailing, vehicle-specific packages, and customizable add-ons.
- **Paint protection and restoration:** Paint Protection Film (PPF), ceramic coating, paint correction, polishing, surface restoration, and other approved protective services.
- **Commercial and specialized services:** fleet detailing, truck and heavy-vehicle detailing, dealership detailing, commercial vehicle maintenance and cleaning, aircraft detailing, boat and marine detailing, and heavy machinery detailing.

Standard services may use predefined pricing and durations. Specialized services may require inspection, quotation, or administrator approval before a booking is confirmed.

3.1.4. Website Administration and SEO

Authorized administrators must be able to manage page content, service descriptions, images and media, pricing and packages, FAQs, franchise and location pages, SEO titles and descriptions, metadata, forms, and promotional content.

The preferred implementation must provide an appropriate content management workflow without requiring developers to modify code for routine content changes. The final content management approach will be confirmed during technical discovery.

4. Custom Booking Management System

The existing BookingPress Pro system will be replaced by a custom booking engine integrated directly into the new platform. The system must support customers, administrators, franchisees, location managers, and employees according to their assigned permissions.

4.1. Online Booking

- Browse available services; select a service or package; select a vehicle category.
- Enter relevant vehicle information and select applicable add-on services.
- Choose an available franchise location and date/time.
- Enter customer contact information and create an account or proceed using guest booking, subject to the final workflow.
- Pay a deposit or the full amount where required.
- Receive booking confirmation; view, reschedule, or cancel eligible bookings.
- Access booking history and invoices.

Vehicle information may include make, model, year, registration details, and other fields required by the selected service. Forms must accommodate cars, motorcycles, commercial vehicles, aircraft, boats, and specialized equipment.

4.2. Service and Pricing Configuration

- Fixed-price services; vehicle-dependent pricing; service package pricing; add-on pricing.

- Different service durations and location-specific availability.
- Configurable franchise-specific pricing, subject to the final franchise permission model.
- Deposits and full prepayments; discounts and promotional codes; applicable taxes.
- Custom quotations for services that cannot be priced accurately online.

Authorized users must be able to configure service availability and scheduling rules.

4.3. Scheduling and Availability

- Location-specific business hours and employee availability.
- Service duration, scheduling conflict prevention, and configurable buffer times.
- Appointment capacity management; holidays and blocked dates.
- Booking rescheduling, cancellation rules, and status management.

Availability must be calculated centrally to prevent conflicting bookings across the website, administration dashboard, and employee portal.

4.4. Booking Statuses

- Pending; Awaiting Payment; Confirmed; Scheduled; In Progress; Completed; Cancelled; Rescheduled; No-Show; Awaiting Quote or Approval.

The final workflow may vary according to the selected service.

4.5. Administrative and Walk-In Bookings

Authorized administrators, franchisees, and location managers must be able to create bookings directly from the internal dashboard for website reservations, telephone enquiries, walk-in customers, dealership requests, commercial fleet requests, and manually scheduled appointments.

Internal users must be able to select or create a customer record, associate a vehicle, select services, assign employees, set appointment details, and record payment information. Walk-in bookings must be recorded even when customers pay in cash.

4.6. Customer Accounts

- Manage profile and maintain multiple vehicle records.
- View upcoming appointments and previous bookings.
- Reschedule or cancel eligible bookings.
- Access invoices and relevant payment records.
- Rebook previously purchased services.

Guest booking must remain available if required by the approved customer journey.

5. Centralized Administration Dashboard

5.1. Dashboard Overview

- Upcoming bookings, today's appointments, and booking status distribution.
- Revenue and payment summaries; outstanding invoices.
- Franchise and location performance; employee assignments.
- Completed and pending jobs; customer activity.
- Dealership and fleet activity.

Dashboard metrics must be restricted according to the logged-in user's permissions.

5.2. Centralized Management

- Website content and configuration; services and packages; pricing rules; bookings.
- Customers and vehicle records; franchises and locations; employees and access permissions.
- Payments and invoices; dealership and commercial accounts; operational and financial reports.
- Email templates and notification settings; calendar integrations; Mailchimp settings.

5.3. Role-Based Access Control

Role	Proposed access
Super Administrator	Complete authorized platform access, franchise management, global settings, and platform-wide reporting.
Franchise Administrator	Assigned franchise operations, authorized locations and employees, bookings, customers, invoices, and reports.
Location Manager	Assigned location bookings, employee schedules, walk-in bookings, payment recording, and service completion.
Employee / Detailer	Assigned jobs, relevant customer/vehicle details, job status, and permitted time/attendance functions.
Finance / Accounting User	Authorized invoices, transactions, reconciliation information, and reports.
Customer	Own account, bookings, and invoices.

The final roles and permissions must be configurable and approved before implementation.

5.4. Franchise and Location Isolation

Users must only access data within their assigned authorization scope. For example, a franchise employee must not be able to view another franchise's bookings unless explicitly authorized. Access restrictions must apply to the backend and APIs, not merely to the visible dashboard interface.

The platform must support centralized oversight while allowing selected users to manage individual locations.

6. Franchise Management System

The platform must support expansion through a multi-franchise structure. All franchises will operate under the same primary brand and website.

6.1. Franchise Structure

Dapper Detailing Pros Central Administration → Franchise → Location → Employees and operational resources

The system should allow a franchise to contain one or more locations, subject to the final operating model.

6.2. Franchise Features

- Create and manage franchises; assign locations; activate or deactivate franchise accounts.
- Assign franchise administrators and employees to franchises/locations.
- Configure operating hours and authorized services/pricing.
- Manage local appointment availability and view franchise-specific bookings.
- Review authorized operational and financial reports.
- Control access to customer, employee, and invoice records.

6.3. Franchise Website Experience

The public website must provide a consistent customer experience across all franchise locations. Customers should be able to select their preferred location and view applicable services, availability, and pricing. Location-specific pages must support SEO and local business information. Separate franchise websites or domains are not included in the initial scope unless separately approved.

6.4. Franchise Permissions

The degree of franchisee control over pricing, services, promotions, customer records, employees, and financial information remains subject to client approval. The system must be designed so these permissions can be configured without requiring separate applications for individual franchises.

7. Employee Portal Revamp

The existing employee portal will be redesigned and integrated into the new platform. Current functionality must be retained and evaluated during discovery to identify dependencies, business rules, and any additional features requiring migration.

7.1. Employee Management

- Employee profiles and account creation/management.
- Franchise and location assignments; role and permission assignment; employment status.
- Employee onboarding and documentation; training materials; assessments and tests; completion tracking.

7.2. Time and Attendance Tracking

- Employee clock-in and clock-out; recorded working hours; attendance history.
- Timesheet generation, review, and approval.
- Break tracking where required; overtime calculations where applicable.
- Exportable attendance records associated with the employee and franchise/location.

7.3. GPS and Location Tracking

- Record employee location during authorized tracking sessions.
- Associate location information with relevant work activities.
- Review recorded location information through authorized dashboards.
- Configurable access permissions and appropriate controls for tracking visibility and retention.

Continuous background tracking, mobile operating-system limitations, employee consent, and applicable Canadian privacy and employment requirements must be assessed before implementation.

7.4. Job Assignments and Employee Bookings

- Appointment date/time; required customer details; vehicle details; selected services.
- Job location, service instructions, notes, booking status, and assigned employees.
- Job start and completion records.
- Employee job-status updates according to permissions.

Completed jobs should be available to the administrative team for invoice finalization and related operational workflows.

7.5. Dealership and B2B Management

- Dealership account records and identifiers/tags.
- Vehicle intake records; job creation for dealership vehicles; bulk job management.

- Job status tracking and completed service records.
- Dealership-specific invoicing; outstanding balance tracking.
- Reporting by dealership, franchise, and service period.

7.6. Mobile Responsiveness

The employee portal must be optimized for smartphones, tablets, and desktop devices. Employees should be able to review assigned work, record attendance, update job statuses, and perform other authorized actions through a responsive interface. A dedicated native mobile application is not included unless separately approved.

8. Square Payment Gateway and POS Integration

Square will be integrated with the custom platform to support online payments and in-person transactions. The exact integration approach must be finalized after reviewing the client's existing Square Point of Sale application, hardware, merchant accounts, and transaction workflows.

8.1. Online Payments

- Payment collection during booking; deposit payments; full prepayments.
- Transaction status updates and payment confirmation.
- Refund processing by authorized users.
- Payment references associated with bookings and payment records accessible from the dashboard.

A payment must not be treated as successful until the appropriate payment confirmation has been received.

8.2. In-Person POS Workflows

1. An authorized employee creates or opens a booking.
2. The employee selects applicable services and add-ons.
3. The system calculates the payable amount.
4. The employee initiates the supported Square checkout workflow.
5. The customer completes payment through the configured Square POS process.
6. The platform records the transaction reference and payment status.
7. The booking and relevant financial records are updated.

The final method of initiating POS payments depends on the capabilities of the existing Square POS application and hardware.

8.3. Cash Payments

Cash payments must be supported within the custom dashboard. Authorized employees must be able to mark a booking as paid by cash, subject to permissions and audit controls. The dashboard must record payment method, amount, date/time, employee who recorded the payment, associated booking/invoice, and relevant notes or references. Cash payments will be recorded in the custom platform; synchronizing cash transactions with Square is not required.

8.4. Square Integration Considerations

- Existing Square account structure and franchise-specific merchant accounts.
- Supported POS hardware and payment methods; payment routing and settlement.
- Refund permissions; transaction reconciliation.
- Square customer and order synchronization.
- Supported terminal or POS application integration method.

The solution must not assume that all Square POS functionality is exposed through the same integration interface.

9. Custom Invoicing and Financial Records

The platform will include a customized invoice generation and management module. Invoices will be generated and managed through the custom administrative dashboard rather than relying exclusively on Square's invoice templates.

9.1. Invoice Generation

- Business and franchise information; customer details; vehicle details where applicable.
- Invoice number and date; itemized services; add-ons; discounts; applicable taxes.
- Total payable amount; amount paid; outstanding balance; payment status.
- Relevant terms and notes.

Invoices must be available in downloadable PDF format.

9.2. Invoice Workflows

- Draft creation and invoice finalization.
- Invoice delivery by email; payment status updates.
- Partial payment tracking if required; outstanding balance tracking.
- Refund and credit adjustments where applicable.
- Invoice search/filtering and customer invoice history.
- Dealership/B2B invoicing and authorized invoice corrections with audit records.

9.3. Automatic Invoice Delivery

The system must support automated invoice delivery following the configured service completion and invoice finalization workflow. The trigger must be configurable. For example, an invoice may be generated when a job is marked completed and sent after charges and payment information have been verified.

The platform must distinguish between an invoice, a payment receipt, and a paid invoice so customers receive the correct document.

9.4. Franchise Financial Separation

Invoice numbering, business identity, tax details, and financial reporting must support the approved franchise structure. Whether invoices are issued centrally or under individual franchise business entities must be decided before finalizing implementation.

10. Apple Calendar Integration

The platform must provide calendar synchronization for the central administration team, franchise locations, and individual employees.

10.1. Required Functionality

- Synchronize new bookings; update existing events; reflect rescheduling.
- Handle cancelled appointments; assign events to the appropriate calendar.
- Synchronize relevant appointment details; avoid duplicate events.
- Associate bookings with the correct franchise, location, or employee.

10.2. Calendar Structure

- Central company calendar; franchise-level calendars; location-level calendars; individual employee calendars.

The exact calendar hierarchy and sharing permissions will be finalized during discovery.

10.3. Technical Implementation

The implementation team must evaluate a suitable synchronization method compatible with Apple Calendar and the required user accounts. Potential approaches include supported calendar subscription feeds or standards-based calendar synchronization. The selected approach must account for event updates, cancellations, access permissions, and synchronization limitations. Direct, bidirectional editing of Apple Calendar events is not assumed unless explicitly approved and technically validated.

11. Email Notifications and Optional SMS

Email notifications will be the primary communication channel for the initial release. The system must include a configurable notification engine for customers, administrators, franchise managers, and employees.

11.1. Customer Emails

- Booking confirmation; rescheduling; cancellation; appointment reminders; payment confirmation; invoice delivery; service completion; relevant booking updates.

11.2. Administrative Emails

- New bookings; booking changes and cancellations; payment failures where applicable; new customer enquiries; quote requests; relevant operational exceptions.

Notifications must be routed according to the relevant franchise, location, and administrative permissions.

11.3. Employee Notifications

- New job assignments; appointment changes; booking cancellations; relevant schedule updates.

11.4. Notification Configuration

- Email templates; sender details; notification recipients; applicable booking events; reminder timing; franchise-specific notification routing.

Email delivery must be implemented using a suitable transactional email service.

11.5. Optional SMS

The platform architecture should allow SMS notifications to be enabled in a future phase. SMS provider integration, message templates, delivery reporting, consent management, and associated costs must be separately evaluated if SMS is activated. SMS delivery is not mandatory for the initial release.

12. Mailchimp Integration and Popup Form Builder

Mailchimp will be integrated into the website for marketing subscriptions, lead capture, and campaign audience management.

12.1. Mailchimp Integration

- Connection to the authorized Mailchimp account.
- Submit website form data to the appropriate audience.
- Map form fields to Mailchimp contact fields.
- Handle subscriber status and configurable audience selection.
- Handle duplicate email addresses and subscription status.
- Apply appropriate consent and subscription handling.
- Handle errors for unsuccessful submissions.

The implementation must follow Mailchimp's supported integration methods and API requirements.

12.2. Custom Popup Form Builder

The website administration dashboard must provide a popup form management interface so authorized administrators can configure routine changes without code modifications.

- Create and edit popup forms; set titles and descriptions.
- Configure form fields, including names and email addresses; define required and optional fields.
- Connect forms to Mailchimp audiences.
- Configure submission confirmation messages.
- Enable or disable popups; configure basic display conditions.
- Configure timing, frequency rules, and applicable website pages.
- Customize basic visual appearance and track form submissions.

Additional fields, such as phone number or preferred service, may be supported if required by the approved configuration.

12.3. Popup Display Rules

- Display after a specified time; display on selected pages; limit repeated displays; suppress the popup after successful submission where appropriate.

Advanced behavioural targeting or marketing automation is an enhancement unless explicitly included.

12.4. Privacy and Consent

The integration must respect applicable marketing consent requirements. Subscription consent must not be assumed merely because a customer makes a booking or submits a service enquiry. The implementation must account for applicable Canadian anti-spam and privacy requirements, including the distinction between transactional communications and marketing messages.

13. Data Migration and Existing System Transition

Data migration is a required component of the project. Existing website and internal portal data must be assessed before migration.

13.1. Booking Data Migration

- Assess the current BookingPress Pro database and available exports.
- Identify relevant booking fields and relationships.
- Map existing booking data to the new database structure.
- Migrate agreed historical and future booking records.
- Preserve relevant customer, service, date, status, and payment-reference information where available.
- Validate migrated records; identify unsupported or incomplete records.
- Produce a migration reconciliation report.

Historical booking migration must preserve information available in the source system without inventing missing records or payment information.

13.2. Other Existing Data

The initial requirement is to retain booking data from BookingPress Pro. Migration of other historical information—such as old website content, employee records, attendance records, dealership data, and historical invoices—must be assessed separately during discovery. Existing employee portal functionality must be retained, but historical employee data migration depends on the agreed data inventory and source-system accessibility.

13.3. Migration Testing

- Source-data analysis; data mapping; test migration; record-count reconciliation; sample-record verification; booking workflow testing; final migration validation.

A final migration and cutover plan must be approved before the legacy booking system is retired.

14. Security, Privacy, and Auditability

Security must be incorporated into the design and implementation of the platform.

14.1. Access Security

- Secure authentication; role-based access control; franchise/location data isolation; server-side authorization; secure password handling; session management; protection against common web application vulnerabilities; secure API authentication and authorization.

Multi-factor authentication should be considered for administrative accounts.

14.2. Audit Logs

- User and permission changes; booking modifications; payment status changes; invoice modifications; refund actions; employee record changes; franchise configuration changes.

Audit records must identify the relevant user, action, timestamp, and affected record where technically appropriate.

14.3. Privacy and Data Protection

The platform must incorporate appropriate safeguards for customer, employee, location, and financial information. The implementation must account for applicable Canadian privacy requirements and relevant provincial requirements based on the business's operations. Employee GPS tracking and time records must be handled according to approved tracking policies, access restrictions, and retention requirements.

14.4. Operational Security

- Secure storage of integration credentials; encryption in transit; appropriate protection of sensitive stored information; database backups; error logging and monitoring; recovery procedures; protection against unauthorized access; appropriate handling of payment information.

Card data should be processed through supported payment-provider mechanisms rather than stored directly in the custom platform unless a separately reviewed and compliant design explicitly requires otherwise.

15. Proposed Technical Architecture

The implementation team will evaluate and finalize the technical stack during discovery. The platform should use a modular architecture that supports independent development of the public website, booking engine, employee portal, administrative dashboard, and integration services.

15.1. Proposed Components

- **Frontend:** custom responsive website, customer account interface, booking interface, central administration dashboard, employee and franchise portal.
- **Backend:** API-driven application architecture; booking and scheduling services; franchise and permission management; customer and vehicle management; employee and attendance management; invoice and payment workflows; notification services; calendar and marketing integrations.
- **Database:** relational database for bookings, users, franchises, locations, employees, invoices, and other structured records.
- **External integrations:** Square; Apple Calendar-compatible synchronization; Mailchimp; transactional email provider; optional future SMS provider.

15.2. Backend Technology

Go and Node.js are both acceptable candidates. The final choice must consider development and maintenance requirements, integration compatibility, booking and scheduling complexity, background jobs and notification delivery, authentication and authorization, reporting requirements, long-term scalability, and availability of qualified developers.

The selected architecture must provide a single source of truth for bookings and operational records.

15.3. Integration Reliability

- Failed payment requests; duplicate payment notifications; delayed calendar updates; failed email deliveries; Mailchimp API errors; retry handling; duplicate event prevention; integration status monitoring.

Where supported, payment notifications and other asynchronous events should be processed idempotently to avoid duplicate transactions or records.

16. Reporting and Analytics

The platform should provide role-appropriate reporting, including:

- Bookings by date range, location, and franchise.
- Revenue by service, franchise, and location.
- Payment method summaries and outstanding invoices.
- Employee working hours and job completion.
- Dealership job summaries and fleet service summaries.
- Customer booking history.

Access to financial and employee reports must be restricted according to assigned permissions. Detailed payroll processing, accounting software integration, and advanced business intelligence are excluded unless approved separately.

17. Testing and Quality Assurance

The implementation team must test the complete platform before production launch.

17.1. Functional Testing

- Website navigation; service selection; booking creation and modifications; scheduling and availability; customer accounts; walk-in bookings; employee assignments; invoice generation; notification delivery; Mailchimp form submissions.

17.2. Payment Testing

- Online payment workflows; deposits and full-payment scenarios; supported Square POS workflows; cash payment recording; failed payment handling; payment status reconciliation; refund workflows where implemented.

17.3. Permission Testing

- Super administrator, franchise administrator, location manager, employee, and customer access; franchise data isolation; prevention of unauthorized API access.

17.4. Integration Testing

- Square integration; calendar synchronization; email notifications; Mailchimp integration; booking and employee portal synchronization.

17.5. Performance and Security Testing

- Responsive interface testing; common browser compatibility; performance testing; security testing; backup and recovery validation; error-handling verification.

User acceptance testing must be completed before final production launch.

18. Project Deliverables

1. Approved requirements specification.
2. Approved website sitemap and UI/UX designs.
3. Custom responsive public website.
4. Custom booking engine.
5. Customer account and booking history functionality.
6. Central administrative dashboard.
7. Multi-franchise and multi-location management functionality.
8. Role-based access control.
9. Revamped employee portal.
10. Employee onboarding and assessment functionality.
11. Employee time and attendance tracking.
12. GPS/location-tracking functionality, subject to approved technical and privacy requirements.
13. Dealership and B2B job management.
14. Square online payment integration.
15. Supported Square POS integration.
16. Cash payment recording.
17. Customized invoice generation and management.
18. Apple Calendar synchronization.
19. Automated email notification workflows.
20. Mailchimp integration.
21. Custom popup form builder.
22. Booking data migration.
23. Integration and security testing.
24. Production deployment.
25. Technical documentation.
26. Administrator and user documentation.
27. Handover and training for designated administrators.

Any additional deliverables must be documented through the approved change-control process.

19. Proposed Project Phases

Phase	Activities
1 — Discovery and Requirements	Review website, BookingPress Pro, booking data, employee portal, workflows, franchise permissions, Square setup, and technical requirements.
2 — UI/UX Design	Website wireframes and visual design, booking journey, admin dashboard, employee portal, customer account interface, responsive layouts.
3 — Core Platform Development	Backend and database, authentication and authorization, customer/vehicle management, booking engine, scheduling, franchise/location management.
4 — Website and Dashboard	Public website, booking interface, customer accounts, central admin dashboard, franchise and location dashboards.
5 — Employee Portal	Employee management, onboarding/testing, time and attendance, GPS/location tracking, job assignments, dealership/B2B workflows.
6 — Integrations	Square payments and supported POS workflows, customized invoicing, Apple Calendar, email notifications, Mailchimp and popup form builder.
7 — Migration and Testing	Booking migration, reconciliation, functional and integration testing, permissions/security testing, user acceptance testing.
8 — Deployment and Handover	Production deployment, domain/infrastructure configuration, administrator training, documentation, monitoring, stabilization, legacy transition.

The sequence may be adjusted following technical discovery.

20. Assumptions and Dependencies

1. The existing website and BookingPress Pro system will be available for assessment.
2. The client will provide appropriate access to existing booking data and the employee portal.
3. Existing booking data will be migrated according to the approved migration mapping.
4. Square integration depends on the client's existing account, hardware, supported APIs, and account permissions.
5. Calendar synchronization depends on the selected Apple Calendar-compatible approach and permissions available for relevant calendars.
6. Mailchimp integration requires access to an authorized Mailchimp account.
7. Transactional email delivery requires an appropriate email provider and verified sending configuration.
8. Franchise permissions and business rules will be finalized before the relevant functionality is completed.
9. The final technical architecture will be approved during discovery.

Third-party subscriptions, payment-processing charges, messaging costs, and other recurring service fees are separate from development costs unless otherwise agreed.

21. Exclusions and Items Requiring Separate Approval

- A separate native Android or iOS application.
- Separate franchise websites or independently branded domains.
- SMS notification delivery.
- Advanced marketing automation beyond the agreed Mailchimp integration.
- Accounting software integrations.
- Full payroll processing.

- Advanced inventory and parts management.
- Franchise royalty calculation and automated royalty collection.
- Franchise fee collection and franchisee contract management.
- Advanced bidirectional calendar editing.
- Historical data migration beyond the agreed booking data and specifically approved employee/business records.
- Paid third-party services and subscriptions.
- Hardware purchases.
- Additional integrations not listed in this document.

These exclusions can be revisited during discovery.

22. Acceptance Criteria

1. The approved website design has been implemented across supported devices.
2. Customers can complete the agreed booking workflows.
3. Authorized internal users can create and manage bookings, including walk-in bookings.
4. Booking records are synchronized across the relevant administrative and employee interfaces.
5. Franchise and location access restrictions operate as approved.
6. The employee portal supports the agreed existing functionality.
7. Square payment workflows function in the approved test environment and supported production configuration.
8. Cash payments can be recorded in the dashboard with the required audit information.
9. The customized invoice system generates and delivers the approved invoice formats.
10. Calendar events are created and updated according to the approved synchronization rules.
11. Configured email notifications are delivered successfully under normal operating conditions.
12. Mailchimp forms and popup subscriptions work as approved.
13. Existing booking data has been migrated and reconciled against the approved migration criteria.
14. Critical defects identified during acceptance testing have been resolved.
15. Technical documentation and agreed handover activities have been completed.

Acceptance testing must use an agreed test plan and documented pass/fail criteria.

23. Change Management

Any feature, integration, workflow, or deliverable not explicitly included in the approved scope must be evaluated through a change request.

- Requested change and business justification.
- Functional and technical implications.
- Additional development effort and cost implications.
- Impact on the delivery schedule.
- Approval from the designated client representative.

Work on additional requirements should commence only after the change request has been approved.

24. Final Project Outcome

The final outcome will be a unified, custom-built digital platform for Dapper Detailing Pros that combines the public website, online booking system, customer accounts, centralized administration, franchise management, employee operations, Square payment workflows, customized invoicing, calendar synchronization, and marketing lead capture.

The platform will provide centralized visibility and control while allowing authorized franchisees, location managers, and employees to operate within their assigned permissions. The solution will be designed to support the company's current operations in Canada and provide a scalable foundation for future franchise expansion.

25. Decisions to Confirm During Discovery

Decision	Current status / requirement
Website CMS approach	WordPress is to be replaced for the website; retain only existing booking data from BookingPress Pro. Confirm the content-management approach for routine page edits.
Square account structure	Not decided. Confirm whether franchises use separate merchant accounts, a central account, or a hybrid structure.
Franchise permissions	Not decided. Confirm control over prices, services, promotions, employees, customers, and financial reports.
Square POS workflow	Existing setup described as Square POS. Confirm exact application/hardware and supported checkout integration.
Calendar sync	Company, franchise, location, and employee calendars are required. Confirm authoritative calendars and one-way/two-way expectations.
Customer booking	Customer accounts are required; confirm whether guest checkout is also enabled.
Historical data migration	Booking data must be retained. Other historical employee, attendance, dealership, and invoice data require assessment and approval.
Optional SMS	Email is required for launch; SMS should remain an optional future capability.
Mailchimp	Mailchimp integration and configurable popup form builder are required.

End of Scope of Work
